#### **EXPLANATORY NOTES**

#### Introduction

In association with the May 1982 labour force survey conducted throughout Australia, persons aged fifteen to sixty-four years who had attended an educational institution in 1981 or were attending one at the time of the survey were asked about their labour force participation. Separate information was obtained in respect of persons who were full-time students in 1981 and had continued their full-time education in 1982 and those who had not returned to full-time education in 1982 (described in this publication as leavers).

- 2. During the two weeks beginning Monday 10 May 1982, specially trained interviewers asked questions of those of the 69,000 respondents in the May labour force survey who fell within the scope of this survey.
- 3. Results of similar surveys, the first conducted in February 1964, have been published in *Transition From Education to Work, Australia* (6227.0).

#### Scope

- 4. The survey includes all civilians aged fifteen to sixty-four years except:
  - (a) certain diplomatic personnel of overseas governments, customarily excluded from census and estimated populations;
  - (b) overseas visitors holidaying in Australia;
  - (c) dependants of non-Australian defence forces personnel stationed in Australia;
  - (d) persons permanently unable to work, some patients in hospitals and sanatoria and inmates of jails, reformatories etc.

#### **Definitions**

- 5. Definitions of the principal labour force categories appearing in this publication are given in *The Labour Force, Australia* (6203.0).
- 6. An educational institution is defined as any institution whose primary role is education. Included are schools, universities, colleges of advanced education, public and private colleges, etc. Excluded are institutions whose primary role is not education, for example hospitals.
- 7. Persons are regarded as attending an educational institution full-time if the institution which they are attending so classifies them or they consider themselves to be attending full-time.
- 8. Leavers from educational institutions are persons who were full-time students at some time in the previous year but are not currently full-time students.

#### Comparability of series

9. The scope of surveys prior to 1977 was restricted to persons aged fifteen to twenty-four years and from 1977 to 1980 inclusive, fifteen to twenty-five years. In 1981 the survey was expanded to include all persons aged fifteen to sixty-four years. Care should therefore be exercised in comparing estimates from this survey for persons aged fifteen to twenty-four years with those from previous surveys which relate to persons aged fifteen to twenty-five years.

#### Reliability of the estimates

- 10. Estimates in this publication are subject to two sources of error:
  - (a) sampling error: since the estimates are based on information obtained from occupants of a sample of dwellings, they may differ from the figures that would have been produced if all dwellings had been included in the survey. More information on this topic is given in the Technical note.
  - (b) non-sampling error: inaccuracies may occur because of imperfections in reporting by interviewers and respondents and errors made in the coding and processing of data. These inaccuracies may occur in any enumeration, whether it be a full count or only a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

#### Related publications

11. Other ABS publications which may be of interest include:

The Labour Force, Australia (6203.0)-issued monthly

Transition From Education to Work, Australia (Including leavers from schools, universities and other educational institutions), May 1981 (6227.0)

Labour Force Experience, Australia, February 1980 to February 1981 (6206.0)

Persons Not in the Labour Force (Including discouraged jobseekers), Australia, March 1982 (6220.0)

Persons Looking for Work, Australia, June 1981 (6222.0)

12. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be relased in the next few days. The Catalogue and Publications Advice are available from any ABS office.

#### SUMMARY OF FINDINGS

Of the 985,600 persons aged 15 to 64 who attended an educational institution full-time in 1981, 658,300 continued full-time study in 1982. A total of 65,900 were studying part-time and 261,400 were no longer attending an educational institution.

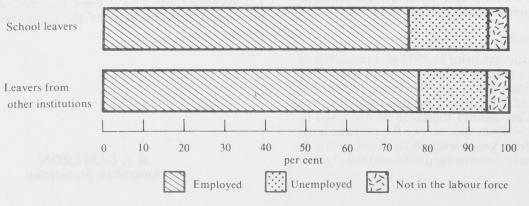

The majority of those who took on part-time study also entered the labour force, in most cases on a full-time basis. About 83.0 per cent were employed in May 1982—comprising 45,900 who were employed full time and 8,800 part time. A further 6,400 were unemployed.

PERSONS AGED 15 TO 64 YEARS WHO ATTENDED FULL-TIME IN 1981 : CURRENT ATTENDANCE AND EMPLOYMENT STATUS (Source of data : Table 1)

Of the 327,300 persons who ceased full-time study, 291,900 were aged 15 to 24 in May 1982. The number of leavers from educational institutions in this age range has been similar in each of the last four years (e.g. 288,200 in the previous year). In May 1982, 93.6 per cent of leavers were in the labour force. A total of 221,700 were employed (195,500 full time) and 551,300 unemployed. This represents an unemployment rate of 18.8 per cent. The unemployment rate for school leavers (19.9 per cent) was slightly higher than that for leavers from other educational institutions (16.3 per cent).

LEAVERS AGED 15 TO 24 YEARS IN MAY 1982 : EMPLOYMENT STATUS AND EDUCATIONAL INSTITUTION ATTENDED IN 1981 (Source of data : Table 6)

A total of 241,600 persons left school in 1981. This number included 55,000 who continued their full-time education at another educational institution, 38,800 who commenced part-time study and 147,700 who had not gone on to further education. Those classed as school leavers (i.e. those who are not continuing with full time education) therefore number 186,600. The number of school leavers was little changed from the previous two years.

About one third of school leavers (59,900) left school before their sixteenth birthday, up slightly from a figure of 54,500 in the previous year. Almost one quarter left school before the end of the 1981 school year (43,000), also a small increase from a figure of 36,300 in the previous year.

A total of 139,900 school leavers were employed in May 1982 (123,900 full-time) and 34,700 were unemployed (an unemployment rate of 19.9 per cent). Female school leavers enjoyed less success in the labour market then their male counterparts (the unemployment rate being 22.7 per cent for females compared with 17.6 per cent for males). As in previous years large numbers of school leavers found employment in the wholesale and retail trade industry (50,200 or 35.9 per cent of all employed school leavers).

PERSONS AGED 15 TO 24 YEARS ATTENDING SCHOOL FULL-TIME IN 1981 (Source of data: Tables 2 and 6)

#### **TECHNICAL NOTE**

#### Estimation procedure

The estimates are derived from the population survey by use of a ratio estimation procedure, which ensures that the estimates conform to an independently estimated distribution of the population for each capital city and remainder of State by age and sex, rather than to the corresponding distribution within the sample itself.

#### Reliability of the estimates

- Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings, they are subject to sampling variability; that is, they may differ from the figures that would have been produced if all dwellings had been included in the survey. One measure of the likely difference is given by the standard error, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included, and about nineteen chances in twenty that the difference will be less than two standard errors. Another measure of the likely difference is the *relative standard error*, which is obtained by expressing the standard error as a percentage of the estimate
- 3. Space does not allow for the separate indication of the standard errors of all estimates in this publication. A table of standard errors for general application is given on the following page. Since they are averages based on calculations for a limited number of past surveys over a wide range of labour force characteristics these figures will not give a precise measure of the standard error of a particular estimate but they will provide an indication of its magnitude.
- 4. An example of the calculation and the use of standard errors in relation to estimates of persons is as follows. Table 2 (page 7) shows the estimated number of persons aged 15 to 24 years who attended university full time during 1981 and were continuing their full-time studies in May 1982 is 74,500. Since this estimate is between 50,000 and 100,000 in the standard error table, the standard error for Australia will be between 2,900 and 3,900 and can be approximated as 3,000 (rounded to the nearest 100). Therefore, there are about two chances in three that the value that would have been produced if all dwellings had been included in the survey will fall in the range 71,500 to 77,500 and about nineteen chances in twenty that the value will fall within the range 68,500 to 80,500. This example is illustrated in the following diagram.

- 5. As can be seen from the standard error table, the smaller the estimate the higher is the relative standard error. Very small estimates are thus subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In the tables in this publication, estimates less than the lowest levels shown in the standard error table have not been published. Although figures for these small components can in some cases be derived by subtraction, they should not be regarded as reliable.
- 6. Proportions and percentages formed from the ratio of two estimates are also subject to sampling errors. The size of the error depends on the accuracy of both the numerator and the denominator. The formula for the relative standard error (RSE) of a proportion is given below:

RSE 
$$(x/y) = \sqrt{[RSE(x)]^2 - [RSE(y)]^2}$$

- 7. Considering the example from paragraph 4 above, the 74,500 persons represent 73.8 per cent of the 100,900 persons who attended university full time during 1981 The standard error of 100,900 is approximately 3,900 so the relative standard error is 3.9 per cent. The relative standard error for 74,500 is 4.0 per cent. Applying the above formula, the relative standard error of the proportion is  $\sqrt{(4.0)^2 (3.9)^2}$  or 0.9 per cent giving a standard error for the proportion (73.8 per cent) of 0.7 percentage points. Therefore, there are about two chances in three that the proportion of 15 to 24 year old full-time university students continuing full-time studies in May 1982 is between 72.6 per cent and 74.0 per cent and nineteen chances in twenty the proportion is within the range 71.9 per cent to 74.7 per cent.
- 8. Published figures may also be used to estimate the difference between two survey estimates (of numbers or percentages). Such a figure is itself an estimate and is therefore subject to sampling error. The sampling error of the difference between two estimates depends on their standard errors and the relationship (correlation) between them. An approximate standard error (SE) of the difference between two estimates (x-y) may be calculated by the following formula:

SE (x-y) = 
$$\sqrt{[SE(x)]^2 + [SE(y)]^2}$$

While this formula will only be exact for differences between separate and uncorrelated characteristics or subpopulations it is expected to provide a good approximation for all differences likely to be of interest in this publication.

9. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by interviewers and respondents. Inaccuracies of this kind are referred to as the *non-sampling error*, and they may occur in any enumeration, whether it be a full count or only a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.
